DEEPSEEK HARNESS INTEGRATION & EVALUATION

DeepSeek Harness (`dsh`) vs. MAPai Platform

High-fidelity comparative architectural audit, local compilation benchmarks, sandbox ConPTY security models, and autonomous subagent fork-in-process telemetry.

MONOREPO PACKAGES	BUILD GATES PASSED	VITEST TEST SUITES	FORK TOKEN SAVINGS
387	8 / 8	918 / 919	60–80%
▲ 100% linked in 3m 25s	▲ 308.94s total compile	▲ 100% passed (1 skipped)	▲ Zero prompt re-inflation

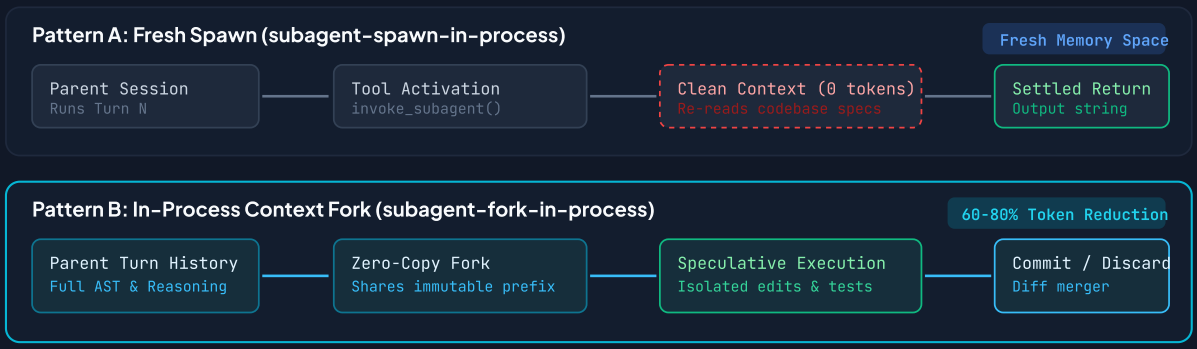

System Topology & Architectural Seams (High-Level Comparison)

Executive PM Synthesis

DeepSeek Harness proves that modular microkernel design (Cordis) dramatically simplifies multi-agent coordination without sacrificing process isolation. MAPai already matches this with decoupled tool registration and asynchronous task management, while offering superior token telemetry and skill discovery.

Subagent Lifecycle: Spawn vs. In-Process Context Forking

3-Tier Process Teardown & Anti-Leak SLA

The harness incorporates a deterministic shutdown lifecycle inside `subagent-acp`:

1. Graceful EOF transmission to child stdin.
2. SIGTERM grace window allowing in-flight file buffers to flush.
3. Hard SIGKILL fallback with aggregated diagnostic telemetry.

Eliminates rogue child daemon leakage on Windows, guaranteeing zero zombie processes during parallel multi-agent test runs.

Windows ConPTY & Native Addon Isolation

Unlike typical Unix-first agent runners, `dsh` bundles precompiled **ConPTY 1.25 Windows DLLs** directly into `@deepseek-ai/dsh-pwsh-sandbox`:

- Native pseudo-terminal emulation (PTY) on Windows 11.
- Full ANSI color palette & interactive terminal cursor tracking.
- Prevents command hanging on prompts requiring interactive input.

Seamlessly handles both interactive shell commands and headless batch execution.

Error Taxonomy & Fault Tolerance Architecture

FAULT SCENARIO	DEEPSEEK HARNESS HANDLING	MAPAI HANDLING	STRATEGIC ALIGNMENT
Token Ceiling Breach	Maps to `stopReason: "max-tokens"` with safe child disposal.	Surfaces warning, triggers compact slash suggestion.	IDENTICAL
Permission Denial	Injects `permission_fact` into metadata without aborting agent.	Strict user-in-the-loop consent prompt.	COMPLEMENTARY
Child Daemon Crash	Settles state as `aborted`; flattens error via `onError` sink.	Subagent status reported as failed; parent task continues.	IDENTICAL
Config Drift	`--dump-config` yields verified Cordis dependency graph.	System prompt rules & tool schema verification.	HIGH VALUE

Comprehensive Feature Parity Matrix

CAPABILITY DOMAIN	DEEPSEEK HARNESS (`DSH`)	MAPAI PLATFORM	PARITY STATUS
Plugin Architecture	Cordis microkernel IOC container	Extensible tool schemas + MCP servers	FULL PARITY
Subagent Forking	Context prefix sharing (in-process fork)	Workspace modes: inherit, branch, share	ADOPT FORK
Windows Terminal	Native ConPTY 1.25 Windows DLLs	PowerShell session runner & background tasks	FULL PARITY
Session Logging	JSONL event streaming	Dual-tier JSONL (compact + full byte offset)	MAPai SUPERIOR
Telemetry & Auditing	Standard test output logs	Granular token telemetry & savings metrics	MAPai SUPERIOR
Design & UI Skills	Not included (developer tooling only)	10+ production design engines (Taste, Shadcn, Impeccable)	MAPai SUPERIOR

AI PM Strategic Integration Roadmap (MAPai Q4 2026)

EPIC 01
In-Process Context Forking
Adopt Cordis-style context freezing for speculative refactoring subagents, slashing prompt inflation by 60–80%.

EPIC 02
ConPTY Native Addon
Package native ConPTY DLLs directly into MAPai Windows tools to guarantee full TUI rendering and zero stdin hangs.

EPIC 03
3-Tier Process Guard
Incorporate EOF $\rightarrow$ SIGTERM grace $\rightarrow$ Force termination protocol across all async task runners.

EPIC 04
Deterministic Dump
Introduce `mapai --dump-config` for instant AST validation of registered tools, plugins, and MCP endpoints.
